## Brunimat milk vending machines

are the ideal milk machine for a wide range of locations, both on farms and in farm shops. The machines combine a dispensing system, milk tanks, agitator, control system and chilled milk compartment in one freestanding unit. The milk machines are customer friendly and uncomplicated to operate, requiring only a simple power supply for operation.

They can be placed in a building or in a sheltered area outside, though very exposed locations should be avoided. Our machines are manufactured internally and externally from 316 stainless steel for ease of cleaning and a high standard of hygiene.

Each machine is built to order which means you can have the exact specification that suits your situation. The Premium range has many variations in tank sizes from 50 - 200 litres and has either single or double tank systems.

There are over 3000 machines across Europe in many varied locations supplying either one or two types of milk - there is even a milkshake maker.

All machines have empty level sensor monitoring and inside temperature surveillance as standard and then you can add in additional features to suit your needs. The machines can come with coin slots, note readers or card readers and there is even a token based memory stick that your customers can have on their car keys.

In addition the machines can be programmed to provide a series of alerts to your mobile phone so you can check remotely on the status on the machine. These features mean that we can tailor a machine to suit your situation best.

## Milk Station Range

There are 4 basic models for vending milk. Each can be tailored to suit individual circumstances and each one is custom built to meet the customers needs. All have optional coin changers, note readers and card readers and can be fitted with full SMS texting features.

### The Premium Milk Station

The Premium milk station can have either a 100 litre or 200 litre tank and either have a simple button push operation or can be fitted with unit that houses coins, notes and cards.

**Dimensions:**

740mm width x 1030mm depth x 2030mm high

**Cost:** From £5890

### The Premium Plus Duo

The Premium Plus Duo has two tanks of either 100 or 200 litre capacity each. Alternatively it can be fitted with four 50 litre tank.

**Dimensions:**

1480mm width x 1030mm depth x 2030mm high

**Cost:** From £7500

### The Premium Duo

The Premium Duo is the same size as the standard machine but has two 50 litre tanks. It too can either be a simple button press or can have the full range of coins, notes and cards

**Dimensions:**

740mm width x 1030mm depth x 2030mm high

**Cost:** From £6370

### The Premium Plus Quattro

The Premium Plus Quattro can have two or four tanks like the standard double machine but is capable of dispensing two types of milk This is described as a bi fluid machine.

**Dimensions:**

1480mm width x 1030mm depth x 2030mm high

**Cost:** From £8290

# Operation

## Simple to Operate

- Each coin put into the machine represents a credit, which is shown on the display as a quantity of milk.
- The machines can dispense any volume from half a litre to five litres.
- One press starts the operation but the filling process can be interrupted at will and restarted. (eg. to change receptacle)
- The machines have a simple to operate key pad inside which you can use to change the programming-no need for an engineer to visit.
- The display informs the customer how to use the vending machine.
- If the machine is fitted with the coin changer option, any remaining credits will be repaid by pressing the return button.

## Optimum Hygiene

- All parts which come into contact with milk in the filling area are chilled (and, on request, can also be made frost-proof).
- The machine has a simple cleaning programme that should be operated every time milk is dispensed
- If there is a fault and the internal temperature of the milk has been exceeded, any payment will be automatic blocked to avoid dispensing milk that has been stored at the incorrect temperature.
- The vending machine will be disabled when the cooling system exceeds the defined milk temperature for a specific time.
- The machine will also be disabled if there is an extended power cut.
- After each filling process, the filling area is rinsed down. It is not necessary to have an external water connection.

## Options

### Double Tank systems

The Premium DUO enables the automatic changeover from the first (empty) tank to the second (full) tank, This ensures that when the first tank is replaced with a full one, the residual milk in the second tank will be completely used, before the machine automatically changes to the new full tank. This avoids both waste and contamination

### Payment systems

- Button press or exact money only
- Coin changer
- Bank note reader
- Card reader with contactless payment

### Text messaging system(SMS)

- Message when the cooling system exceeds the defined milk and / or inside temperature.
- Message when the milk tank is empty.
- Message when a power cut occurs.
- Message when the power is once more available.
- Message how many litres of milk sold since the last filling - every day to the same time
- Message to a second phone number
